

DRYING AND FIRING OF CERAMIC TILES

Contents

Foreword

Authors' note

FIRST PART

DRYING AND FIRING: FUNDAMENTALS

Chapter 1. INTRODUCTION

Considerations regarding production processes

Chapter 2. HEAT

1. The main thermal processes and their dimensions

- 1.1. Temperature and heat
- 1.2. Expansion and contraction
- 1.3. Change of state

2. Combustion

- 2.1. Excess air
- 2.2. Exhaust gas composition

3. Heat transmission

- 3.1. Conduction
- 3.2. Convection
- 3.3. Irradiation
- 3.4. Irradiation in gases
- 3.5. Absorption of microwaves
- 3.6. Mixing of fluids

4. Temperature measurement

5. Temperature control

- On-off type control
- PID type control (with modulating valve only)

Chapter 3. MECHANICS OF GASES AND VAPOURS

1. Pressure

2. Gas laws

- a) Fundamental equation
- b) Boyle-Mariotte law
- c) Gay-Lussac's laws

3. Transformations

- a) isobaric (constant pressure)
- b) Constant volume
- c) Isothermal (constant temperature)
- d) Adiabatic (without exchange of heat)

4. Motion of gases in ducts

5. Pressure measurement

6. Fans

Chapter 4. INTERNAL STRESSES

1. The causes of internal stresses

2. Stresses and strains in the tile

3. Plasticity, yield, mechanical strength and plastic flow

4. Stress concentration factor and crack propagation

5. Stresses in a plane

6. Special cases

- 6.1. Solid state transformations
- 6.2. Double layer
- 6.3. Inclusions

7. Cooling

- 7.1. Residual stresses in fired product
- 7.2. Bending due to cooling

8. Effects of anisotropy

SECOND PART: DRYING

Chapter 1.

1. Introduction

2. Drying unfired ceramic bodies

- 2.1. The porous body
- 2.2. Water inside the body

3. Behaviour of the clay body

4. Fast drying theory

- a) Surface evaporation
- b) Migration of water from the inside towards the outer surface
- c) Evaporation inside the pore
- d) Formation of condensation

5. Heat transmission

6. Slow drying and fast drying

7. Stresses that occur during drying

- a) Small thicknesses (drying individual tiles)
- b) Very large thicknesses (drying in stacks)
- c) Intermediate thicknesses (drying relatively large thicknesses)

8. The ideal cycle

9. Drying defects

Chapter 2. DRYERS

1. Cell dryers
2. Fast vertical dryers
3. Horizontal tunnel or traditional dryers
4. Fast horizontal dryers
5. Radiant heat (infrared) dryers
6. Dryer operation
7. Other uses
 - 7.1. Drying prior to firing
 - 7.2. Drying on the glazing line
 - 7.3. Drying fired products
 - 7.4. Third fire applications

THIRD PART: FIRING

Chapter 1. FIRING AS A CHEMICAL AND PHYSICAL TRANSFORMATION

1. General
2. Chemical and physical transformations
 - 2.1. Solid state transformations
 - 2.2. Mixtures and eutectics
3. THERMAL TESTS
 - 3.1. Thermomechanical analysis (TMA)
 - 3.2. Differential thermal analysis (DTA)
 - 3.3. Thermal gravimetric analysis (TGA)
4. The main reactions that occur during firing
5. Vitrification curves
6. Firing diagram
 - 6.1. Single firing cycle
 - 6.1.1. Red body single firing – final porosity 3-6 %
 - 6.1.2. White body single firing – final porosity ~ 3%
 - 6.1.3. High-porosity single firing - final porosity 10-18%
 - 6.1.4. Porcelain tile – final porosity <0.5%
 - 6.2. Double firing cycle
 - 6.2.1. First firing (biscuit firing)
 - 6.2.2. Inertisation
 - 6.2.3. Second firing (glaze firing)
 - 6.3. Third firing
7. Effects concerning the glaze
 - 7.1. Behaviour of glazes during firing
 - 7.2. Interactions between glazes during firing

Chapter 2. THE ROLLER KILN

1. General introduction
2. Composition
 - 2.1. Pre-kiln
 - 2.2. Pre-heating
 - 2.3. Heating
 - 2.4. Firing

- 2.5. Fast direct cooling
- 2.6. Slow indirect cooling
- 2.7. Fast final cooling
- 2.8. Additional cooling

3. Temperature distribution over the cross-section of the kiln

Chapter 3. The roller kiln: thermal aspects

1. The combustion system

- 1.1. General
- 1.2. Comparison between the burner control systems

2. Gas system

- 2.1. Fuels
- 2.2. Fuel supply system
- 2.3. Temperature adjustment

3. Movement of air and combustion gases

- 3.1. Combustion gases
- 3.2. Cooling air
- 3.3. Other factors affecting firing

4. Exhaust gas purification: general principles

5. Heat recovery

Chapter 4. The roller kiln: Movement of tiles during firing

1. The roller conveyer

2. Rollers

- 2.1. Metal rollers
- 2.2. Ceramic rollers

3. Sizing of roller cross-sections

4. Precautions in using rollers

5. Alignment of the tiles

6. Accessories

- 6.1. Kiln loading
- 6.2. Kiln unloading

Chapter 5. FIRING DEFECTS

1. Edge cracks

- 1.1. Pre-heating breakages
- 1.2. Cooling cracks
- 1.3. Drying cracks
- 1.4. Observations

2. Cracks and fractures not involving the tile edge

3. Black core

4. Dimensional defects

- 4.1. Flatness defects
- 4.2. Shape defects

5. Glaze defects

- 5.1. Gloss loss
- 5.2. Crazing
- 5.3. Bubbles, pinheads, holes, dimples, depressions
- 5.4. Colour variations

6. Problems that occur in the kiln

Chapter 6. TESTS AND VERIFICATIONS DURING FIRING

1. Kiln checks

2. Product checks

APPENDICES

APPENDIX A: Thermal shock: Temperature distribution within a body

APPENDIX B: Frost resistance and porosity

APPENDIX C: Residual glaze-body tensions caused by cooling

APPENDIX D: Vitrification theories

APPENDIX E: The properties of ceramic materials during the firing process

M. Paganelli, C. Venturelli

APPENDIX F: Information on the main raw materials used for tile production

APPENDIX G: Behaviour of non-miscible liquids

APPENDIX H: Kiln walls

APPENDIX I: Temperature distribution inside the kiln

APPENDIX L: Temperature distribution inside the tile

APPENDIX M: Energy consumption

APPENDIX N: Examples of concentrated resistances

TABLES

Thermal expansion coefficient

Approximate values of thermal conductivity coefficients for various materials

Average specific heat capacities of various materials

Heating values of various gases

Heating values of several liquid fuels

Units of measurement
